Brand New Book ***** Print on Demand *****.Excerpt from Robotics Research Technical Report: Computing the Link Center of a Simple Polygon The link center of a simple polygon P is the set of points x inside P at which the maximal link-distance from x to any other point in P is minimized. Here the link distance between two points x, y inside P is defined to be the smallest number of straight edges in a polygonal path inside P connecting x to y. We also give an 0{n log n) algorithm for finding a point x in an approximate link center, namely the maximal link distance from x to any point in P is at most one more than the value attained from the link center. This paper concerns itself with analysis and calculation of the link center of a simple planar polygon P having n sides. The notion of a link distance between two points x, y inside P has been recently introduced in [Sul]; it is defined as the smallest number of links (i.e. straight segments) in a polygonal path connecting x and y within P, and is a useful metric for path planning within P when straight motion is easy to accomplish but turns are expensive.
